OVERVIEW

Boiler Tube Company of America is one of the few fully integrated fabricators of boiler tube pressure part components and suppliers of automated boiler tube weld overlay in the United States.

Boiler Tube Company of America is a leader in providing boiler replacement pressure part components that improve unit performance by extending component life. Primary to achieving extended life is the use of Boiler Tube Company of America’s spiral clad tubing that utilizes state-of-the-art welding technology. Boiler Tube Company of America has developed a Hot Wire Gas Tungsten Arc welding process using Wave Pulse Technology (patented). Use of the Wave Pulse Technology with automatic hot wire TIG utilizing a fully integrated robotic microprocessor controlled system results in reduced weld metal dilution chemistry throughout the thickness of the overlay and favorable fusion properties.

As one of the few integrated fabricators of boiler tube pressure components and suppliers of automated boiler tube weld overlay in the United States, we are uniquely qualified to address the major conflicting issues of fusion and dilution of the overlay materials. Element composition in the overlaid material is affected by dilution with the base metal. Although there are no requirements or standards for fusion for weld overlay by the ASME Code, proper fusion is critical. Fusion of the overlaid weld to the base metal for fabricated items is required to ensure cracking and breaking of the overlaid tube does not occur during the bending process as well as to ensure good heat transfer. Fusion results in dilution of the base material with the overlaid material. Low dilution rates can easily be achieved during the overlay process but at the expense of poor fusion.

This results in failures at the bend area and poor heat transfer. By experimentation and testing by Boiler Tube Company of America’s weld overlay and boiler tube bending technical teams, we have developed welding and bending procedures that assure exemplary results.

REPLACEMENT BOILER PRESSURE PARTS

It is the complex control of a large number of interrelated parameters that results in an acceptable project. Some of these parameters include the following:

- Selection of boiler tubing specification and dimensions
- Selection of an overlay material that will address the unique problems
- Overlay deposited thickness
- Bending configuration
- Attachment configuration
- Material and welding procedures
- Waterwall membrane configuration
- Overlay welding process including the following:
  - Lineal travel speed
  - Circumferential travel speed
  - Wire feed speed
  - Arc
  - Base metal temperature (cooling)
  - Wire temperature
  - Amperage and voltage
  - Configuration of the wave pulse
PROTECT YOUR INVESTMENT

Boiler Tube Company of America can assist you in implementing a full range of potential solutions for correcting and reducing tube deterioration.

- Redesign of the pressure part component to reduce gas velocity or increase corrosion resistance
- Application of corrosion and erosion resistant spray coatings
- Supply of tube shields
- Supply of composite tubing
- Application of weld overlay utilizing an appropriate filler material using our patented process

Spiral overlaid tubing for the mitigation of erosion-corrosion in boilers has been used successfully for many years in a wide variety of tube applications. Depending upon the application and service environment, a suitable erosion-corrosion alloy would be selected and applied to the specific tube section. Boiler Tube Company of America can provide spiral overlaid tubing to suit almost any layout required by your specific boiler application.

Boiler Tube Company of America can and has developed process techniques for fabricating panels from 360° spiral overlaid tubing.

These panels have the fully alloy protection on both sides of the panel - offering not only hot but cold side corrosion protection as an added benefit. Furthermore, they do not suffer from residual stress caused by the shrinkage and distortion issues associated with single sided overlay.

The Patented Wave Pulse Technology System utilizes state-of-the-art robots and assures consistent weld metal disposition.

BENEFITS

- Patented Hot Wire GTAW with Wave Process
- The system utilizes full function (six axis) OTC DR-500R robots with corresponding power supplies and microprocessor controller hardware
- Robotic welding assures consistent weld metal deposition. The weld overlay will be uniform in thickness and exhibit optimum depth of penetration
- Full alloy protection on both sides of the panel with no more cost than single-sided overlay
- Typical overlay materials including nickel and stainless alloys such as alloy 625, 622, 72, 33, 309, 310, 312, etc.
